

Manager Requirements

1. Purpose

The platform shall provide managers with a centralized view of intern activities, project progress, task assignments, deadlines, and attendance/participation.

The objective is to eliminate dependency on scattered communication through platforms such as Microsoft Teams and WhatsApp and establish the platform as the central source of truth for project-related work and accountability.

2. Manager Overview Dashboard

The manager shall have access to a dashboard providing an overall view of the internship program and ongoing projects.

The dashboard should display:

- Total number of interns
- Total number of active projects
- Total number of active tasks
- Tasks completed
- Tasks currently in progress
- Tasks pending
- Tasks past their deadlines
- Number of interns with overdue tasks
- Number of interns who have not attended required team activities
- Number of blocked tasks
- Overall project progress

The dashboard should allow the manager to quickly identify areas requiring attention without having to inspect every intern or task individually.

3. Intern Monitoring

The manager shall be able to view the work status of individual interns.

For each intern, the manager should be able to see:

- Intern profile and assigned section/team
- Projects they are working on
- Tasks and subtasks assigned to them
- Current task status
- Upcoming deadlines
- Missed/overdue deadlines
- Completed work
- Blocked tasks
- Relevant progress updates

- Team/meeting attendance or participation records

The manager should be able to identify interns who require attention based on missed deadlines, incomplete work, or lack of required team participation.

4. Project Monitoring

The manager shall be able to view the status of all projects under their supervision.

For each project, the manager should be able to see:

- Project name
- Project owner/assigned tech lead
- Project sections
- Number of interns involved
- Tasks and subtasks
- Overall project progress
- Completed work
- Pending work
- Overdue work
- Blocked work
- Upcoming deadlines

The system should provide sufficient visibility for the manager to understand whether a project is progressing according to its planned schedule.

5. Task and Deadline Monitoring

The manager shall have visibility into task deadlines across projects.

The system should identify:

- Tasks approaching their deadline
- Tasks that have exceeded their deadline
- Interns with multiple overdue tasks
- Sections with significant pending work
- Tasks that have remained blocked
- Tasks awaiting review

The system should maintain a record of task assignments, deadlines, status changes, and completion dates so that project progress can be tracked over time.

6. Team Participation Monitoring

The platform shall allow the manager to monitor required team participation.

The manager should be able to view:

- Team/section attendance
- Missed team meetings or required sessions

- Participation records
- Interns with repeated missed attendance
- Attendance trends over a selected period

Attendance data should be associated with the relevant intern and team/section.

7. Tech Lead Oversight

The manager shall be able to view the work being managed by each tech lead.

The manager should be able to see:

- Projects/sections assigned to the tech lead
- Tasks created or managed by the tech lead
- Interns working under the tech lead
- Task distribution
- Pending and overdue work
- Blocked tasks
- Overall progress of the tech lead's assigned section

The manager should therefore have visibility across the hierarchy:

Manager → Project → Tech Lead → Section → Intern → Task/Subtask.

8. Centralized Project Record

All official project work should be recorded within the platform.

The platform should maintain a centralized record of:

- Project assignments
- Task assignments
- Subtasks
- Deadlines
- Status changes
- Progress updates
- Comments
- Completion records
- Attendance/participation records

This information should remain accessible to authorized users and should not depend on information being retained in external communication channels.

9. Manager Alerts

The system should notify the manager when important events require attention, such as:

- A task deadline has been missed
- An intern has multiple overdue tasks
- A project falls behind its expected progress

- A task becomes blocked
- An intern repeatedly misses required team activities
- A critical task remains incomplete near its deadline

Notifications should focus on actionable exceptions rather than generating unnecessary alerts.

10. Manager Access

The manager shall have read access to the relevant projects, teams, interns, tasks, subtasks, deadlines, and participation records under their supervision.

Manager permissions should allow oversight without requiring the manager to perform the day-to-day task management that belongs to tech leads.

The primary responsibility of the manager role is:

Monitor → Identify issues → Review progress → Intervene when required.
